

Course Descriptions

□ Undergraduate Program

CE201 Mechanics of Materials

This course covers properties of structural members. These properties include tension, compression and shear forces, strain energy, stress-strain relationship, axially loaded member, torsional members, shear force and bending moment on beams, stresses in beams, stress and strain analysis, principal stress and strain, yielding condition of materials, and deflection of beams

CE202 Structural Mechanics I

This course covers types of structures, forces and stresses, analysis of beams, trusses, frames and grid structures to obtain reactions, stresses, and displacements. It also covers the behavior of structures under moving loads, influence line, behaviors of columns and application of energy methods to structural mechanics.

CE203 Fluid Mechanics & Hydraulics

This course is to discuss about physico-chemical principles of environmental engineering processes including process principles, theories, equations and applications. This course will give emphasis on process principles rather than unit operations. This is because an understanding of process mechanisms and control variables is fundamental for the effective application of unit operations to accomplish specific treatment objectives.

CE206 Introduction to Sustainable Engineering

This course provides methodologies on transportation systems analysis and operations. It covers fundamental theories on transportation systems, transportation system analysis techniques, and methodologies to manage and operate transportation systems in efficient and safe ways.

CE207 Elementary Structural Engineering and Laboratory

This course introduces structural engineering, fundamental theory of material properties, studies on structural analysis and design methods for various types of structures through experiments.

CE208 IT in Construction Engineering

This course focuses on basic IT technologies for civil engineers. Various smart sensors will be studied and the students can apply this knowledge to structural health monitoring and control. Robotic manipulator and mobile robot will be briefly introduced along with the soft computing and intelligent control techniques. Finally ITS (Intelligent Transportation System) and its state of the art will be introduced.

CE210 Evolution of Space and Structures

This course is to understand evolution of spaces and structures in civil, architecture and urban. It is the four-module sequence divided by the important historical events with a particular emphasis on technological innovation. It is structured as dialogue between historical and theoretical frameworks that affect our understanding of built environment. We will explore projects ranged from the classic to the contemporary periods.

CE219 Signals and systems for Construction IT

This course deals with continuous and discrete-time signals and systems. Focusing on the linear time invariant systems, mathematical models of signals and systems, Fourier series, Fourier transform, Laplace transform, and z-transform will be widely dealt with in this course.

CE230 Soil Mechanics and Laboratory I

This course deals with origin of soils, structures, fundamental properties and related problems. It is also taught to explain flow of water in ground, 1-dimensional compression, effective stress, and stress distribution in soils.

CE231 Soil Mechanics and Laboratory II

This course deals with fundamental geotechnical problems and their solutions. It contains consolidation, shear strength, lateral earth pressure, slope stability, environmental geotechnology, subsoil exploration, etc.

CE241 Design Representation Techniques

This course is aimed at exploring the computer visualization for Urban/ Architecture Design. It introduces the

advanced software tools available through whole design process. It focuses on fundamental concepts of two/three dimensional modeling, rendering, animation, and editing, as well as graphic skills with the simple house design consistently. Also, students understand the effective design representation techniques through reviewing various architect/urban designer's drawings.

CE273 Environmental Microbiology

This course is focused on the characteristics of micro-organisms such as chemical composition, biological activity, metabolism, etc. Furthermore, applications of micro-organisms to the energy and metal recovery of refuse, water and wastewater treatment, fuel and biomass productions are briefly introduced.

CE291 Introduction to Geomatics Engineering

This course provides an introduction to Geomatics engineering which deals efficient acquisition, processing and application of geo-spatial information. It includes GIS, Remote Sensing, and GPS.

CE303 Vibration Engineering

This course covers basic concepts of structural dynamics, free and forced vibration of single- and multi-degree of freedom systems, time and frequency domain solution techniques including convolution and Fourier transforms, approximate solution techniques, and vibration and modal analysis of continuous systems such as bars, beams and frames.

CE312 Structural Mechanics II

This course covers application of the principle of least work and the principle of virtual work, deflection and structural behavior of unsymmetrical elements, analysis of curved elements and analysis of statically indeterminate structures.

CE314 Design of Reinforced Concrete Structures

This course introduces design code for concrete structures: design of beams, columns, slabs, and footings.

CE315 Reinforced Concrete and Laboratory

This course covers properties of concrete material, flexural behavior of beam, axial and flexural behavior of column, shear and torsion, bond and anchorage, deflection and crack. Laboratory work is also performed.

CE331 Rock Mechanics

This course covers the origin of rock and its classification, the characteristics and behaviors of rock mass, the shear strength of rock mass, the laboratory and field testing methods of rock, the state of stress, rock mass classification, the mechanical behavior of rock mass, and the applications of rock mechanics to engineering problems.

CE332 Foundation Engineering

This course deals with site investigation, in situ testing, bearing capacity and settlement of shallow foundation; the topics of site improvement, earth pressure theory, retaining wall, pile and pier foundations are also treated.

CE333 Soil Dynamics

This course deals with elastic wave propagation (bar, infinite media, half space), site investigation using elastic waves, dynamic soil properties, nondestructive test and evaluation, vibration criteria, monitoring and control, machine foundations, seismic design code, earthquake ground motion, liquefaction.

CE350 Introduction to Transportation Systems Engineering

This course provides general introduction to Transportation Systems Engineering. It covers transportation planning and policy making process, Transportation system analysis and design, Traffic theories and Safety.

CE355 Introduction to Smart Transportation Systems

Smart Transportation Systems refers to the Systems for sustainable and efficient Transportation systems using less energy and cost. This course provides the ways of planning, developing, and managing Transportation Systems for the life cycle of the transportation infra-structure systems.

CE371 Environmental Chemistry

The goal of this course is to understand global environmental/energy problems using basic scientific knowledge (prerequisite), to identify their impacts on engineered and natural eco-systems, and finally to develop students' ability to solve the environmental/energy problems potentially encountered near future.

CE372 Water and Wastewater Engineering

This course deals with distribution systems of water, collection systems of wastewater, properties of pumps, and physical, chemical, biological unit processes.

CE373 Hydrology

The water cycle and its component processes are introduced. The topic of surface runoff water is discussed in depth. All of the topics are relevant to provide an engineering basis for quantity management of rivers and lakes.

CE376 Solid Waste Management & Soil Remediation

The course is divided into three sections. First one focuses on the need for an integrated solid waste management based on waste reduction, reuse, recycling, combustion for energy recovery, and landfilling. A special attention is paid to the hazardous waste management. The second section deals with the inorganic and organic contamination of soils and remedial technologies. Finally, the course covers a mining-related issue, the acid mine drainage. This last section insists on prevention methods, as well as on the most environmentally sustainable technologies of treatment of mining-impacted waters.

CE393 Construction Management

This course is designed to introduce students various aspects of project management. Upon successful completion of this course students should be able to understand: how a project is formed and conducted/ major planning and scheduling methods/ major estimating and cost control methods/ important roles of project management/ other issues related to project management.

CE410 Making of Ubiquitous Space

This course teaches u-IT(Ubiquitous Information Technology) applications for constructing and operating architectural or urban spaces such as roads, bridges, parks, streets, houses, offices and schools. Elements, technologies, and examples of u-cities and u-spaces will be discussed.

CE412 Design of Steel Structures

This course covers material properties and behavior of steel, understanding and comparison of design codes for steel structures, design of beam-to-column joints, design of steel members such as beams and columns, and fundamental theories for buckling of structural members.

CE413 Prestressed Concrete

This course covers basic concepts of prestressed concrete, material properties, flexural design, shear and torsion, bond and anchorage, anchorage zone design, partial loss of prestress force, composite beams, analysis of continuous beams and deflections.

CE417 Structural Design of Building

This course introduces structural system of high-rise building, building code for reinforced concrete, building code for steel structure, practice of structural design of reinforced concrete and steel high-rise building.

CE419 Experimental Vibration Engineering

This course covers fundamental principles and concepts of structural dynamics including free and forced vibration analyses of single degree of freedom system through experiments. In addition, basic theories and concepts of a tuned mass damper, one of the widely used vibration control devices, will be also covered.

CE435 Geotechnical Engineering Design I

This course is aimed at performing geotechnical engineering design for practice, based on soil mechanics and foundation engineering principles, such as site characterization and geotechnical properties, consolidation and settlement, seepage and its control, retaining wall, slope stability, and foundation.

CE436 Geotechnical Engineering Design II

This course is aimed at performing geotechnical engineering designs for practice, based on soil mechanics and foundation engineering principles, such as excavation sheet pile structures, soil improvement, rock blasting, underground structure and tunnel, pre-reinforcement, and landfill liner.

CE440 Urban Planning

Urban competitiveness under the trend of global urbanization with the fact that urban population occupied over 90% of the total Korean is major issue in terms of academic aspect and national agenda. This course is designed to study the basic knowledges on urban studies such as urban planning theories, techniques and related regulations.

CE443 Building environment

This course provides students with design innovations and construction strategies that maximize the comfort, health, safety, and energy efficiency of buildings. It covers the underlying thermal theories, and thermo-fluid dynamic principles and focuses on design that enhances the building environment and minimizes the impact on the global environments.

CE445 Sustainable Architectural Design

This course introduces the students in this integral design approach for a Sustainable Urban/ Architecture Design. First, this course is to discuss and explore the awareness of the environmental issues and the historical effort how Architecture and Urban planning meaningfully researches. And , each student will have a concept for the sustainable approach and develop his/her design project at the technical and aesthetic levels.

CE471 Water Resources and Groundwater Engineering

To ensure the availability of adequate water supplies in the future, efficient water management is necessary. Management in this sense should include engineering activities and economic, social, political and environmental considerations together. This course should present all these relevant materials in a unified framework, emphasising the planning and design of systems to manage water resources including groundwater.

CE472 Remediation System Design and Engineering

Students will develop understanding of basic approach to remediating contaminated sites and ability to screen, choose, and design appropriate technologies for environmental remediation.

CE474 U-Eco Policy and Management Engineering

This course is to provide a set of operational contributions to environmental policy analysis and to discuss about multidimensional approach to environmental and resource management problems. Also, emphasis is given to an integration of different fields which normally play a role in environmental policy analysis: economics, physics, regional science, ecology and social and political science.

CE481 Special Topics in Civil and Environmental Engineering

This course is offered for undergraduate students to deliver recent issues on civil and environmental engineering practices. For the relevant issues, subtitles can be given to emphasize the related issues.

CE482 Short Course in Civil and Environmental Engineering I

CE483 Short Course in Civil and Environmental Engineering I

CE490 B.S. Thesis Research

CE495 Individual Study

CE498 Venture Internship I

CE499 Venture Internship II

□ Graduate Program

CE501 Advanced Mechanics of Solids

This course covers stress-strain relations, fundamental theories of elasticity based on the tensor method, introduction of plasticity and fracture mechanics, shear and torsion analysis of box sections, introduction of energy theorems and the principle of least work.

CE502 Advanced Soil Mechanics

This course deals with fundamental characteristics of soil behavior, shear strength, consolidation theory for drainage-installed soft ground and some field performance of embankment on soft clay. Several analytical methods of consolidation theories are explained and their results are discussed. The analytical results are compared with those obtained in the field measurements.

CE504 Advanced Environmental Chemistry

The goal of this course is to understand the concept of advanced chemistry and develop the ability of application for the identification of chemical phenomena occurred in natural and engineered environments. The course will provide basic knowledge to properly conduct important environmental researches and to fully understand environmental problems in hazardous waste treatment, wastewater treatment, and contaminated soil and groundwater remediation.

CE505 Applied Mathematics

This course introduces fundamental mathematical techniques related to applied mechanics, dealing with vectors, tensors, analysis of vector fields, matrix and linear equations, eigen-value problems, linear spaces, linear operations, functionals, variational and approximate methods, complex variables, conformal mapping, Fourier transformation and Laplace transformation, etc.

CE514 Structural Dynamics

This course covers single- and multiple-degree-of-freedom vibration problems, normal mode superposition methods, modal analysis and matrix formulation of vibration problems, natural frequency and mode, principle of D'Alembert, Newton's second law, principle of virtual work, and Lagrange's equations for systems of particles and for rigid bodies.

CE515 Mechanics of Composite Materials

This course introduces materials and their applications, anisotropic elasticity, failure theories, hydrothermal behavior, 3-D stress analysis of laminates, hybrid composites and advanced topics, design principles for bracings and members subjected to torsion, design of composite beams, columns, and beam-columns, behavior and design of shear, and semi-rigid and moment connections.

CE516 Finite Element Analysis

The course covers the fundamental theory of Finite Element Methods and its application in structural engineering. It includes shape functions, stiffness matrix, direct methods, variational method, weighted residual method, assembly of stiffness matrix and solution of equilibrium equations, static and dynamic analysis, linear and non-linear problems, and computer programming.

CE518 Reliability Analysis of Structures

This course introduces probability and statistics, extreme value distributions, probability of failure, reliability, reliability index, failure modes of structures, reliability of structures, system reliability, Monte-Carlo simulation, and load and resistance factor design.

CE519 Bridge Engineering

This course covers design code, influence line, load, the Rahmen bridge, the slab bridge, and the PS concrete box-girder bridge.

CE520 Introduction to Smart Structure Technology

This course offers an introduction to the emerging technologies in smart structure systems and the application of smart structures technologies to civil infra-structures. Contents of lectures include the concepts of smart materials and their properties, advanced sensors, signal / information processing, structural health monitoring method, control

theories (passive / semiactive / active) and their applications to civil infra-structures. Students will gain understanding of the state-of-the-art smart structures technologies through lectures and laboratory tests and have chances to work on their application to civil infra-structures.

CE531 Geotechnical Experiments

This course deals with transducer characteristics, calibration, direct shear test, triaxial test (UU, CU, and CD), permeability test (fixed wall, flexible wall), consolidation test, free-free resonant column test, small-strain triaxial test, impact echo test, vibration monitoring, and cross-hole tests.

CE532 Rock Engineering

This course covers an introduction to stress analysis, the physical properties of rock, underground stresses, laboratory and field instrumentation, model studies, rock mass properties, excavation and blasting, and the discussion of a number of rock mechanics field applications associated with civil, mining, and petroleum engineering, and geoscience.

CE533 Site Investigation and Monitoring

This course deals with site investigation plan, boring method, SPT, CPT, DMT, Field Vane Test, PMT, refraction survey, cross-hole test, SASW test and also includes in situ monitoring plan, equipments and case studies.

CE534 Theoretical Soil Mechanics

This course focuses on the critical state theory. Based on the theory, some models to describe the soil behavior are discussed. Especially, Cam-Clay model and its design properties are deeply explained. Upper and lower bound theories are also dealt with to calculate the bearing capacity of foundations.

CE536 Underground Structures

This course is designed for graduate students. Special attention is paid to highlight the common principles unifying the presented set of topics such as geological and geotechnical explorations required, design considerations, construction of tunnels and shafts, geo-mechanical analysis, design of ground water control, and instrumentation and monitoring.

CE539 Earth Retaining Structures for U-Space

This course includes earth pressure theory, site investigation, designs of retaining wall, sheetpile wall, braced excavation, diaphragm wall, reinforced earth, and soil nailing. The performance monitoring of earth structures will also be covered.

CE547 Transportation System analysis and Operations

This course provides methodologies on transportation systems analysis and operations. It covers fundamental theories on transportation systems, transportation system analysis techniques, and methodologies to manage and operate transportation systems in efficient and safe ways.

CE548 Transportation Policy and Legislation

Transportation service, a kind of public goods, is determined largely by government policies. Through such policies, advanced technologies are applied to the transportation system and further developed.

Therefore it is important for the students to understand the mechanism of the transportation policy and its legislation. This course covers transportation policies and laws of various countries.

CE551 Soft Computing Techniques for Engineering Design

This course deals with various numerical and combinatorial optimization techniques for solving engineering and structural design problems. This course puts emphasis on the most recent soft computing-based optimization techniques such as neural networks and evolutionary computation (EC) as well as classical optimization techniques.

CE553 IT for U-Space

This course deals with basic IT technologies which will be used in Ubiquitous-City. Various communication systems, especially wireless communication techniques for smart sensor network, will be studied and the technologies which can implement location based service among the USN-based services will be also dealt with.

CE554 Mechanical Design of Civil Robot

This course deals with mechanical design methodologies of various robots. Robot manipulator, Legged robot, wheeled robot, micro/nano robot will be studied in the view point of mechanical design.

CE556 Intelligent Control for Construction IT

This course deals with identification and control techniques for linear system and dynamic system in the view point of infrastructure. And the later part deals with various intelligent control techniques for construction IT major. Neural networks, evolutionary computation, and fuzzy logic based controllers will be studied. The various reasoning and inference techniques of artificial intelligence will be also introduced.

CE558 Introduction to Civil Robotics

This course is targeted to familiarize graduate students with applied robotics other than EECS and ME. This course helps students understand general civil robotics issues and apply robot techniques to civil engineering application area. Specifically the students can understand fundamental principles of robotics by simulating their application world with robotics simulation tool.

CE560 Environmental Design for U-Eco Spaces

This course explores the intrinsic characteristics and the direction of interactions between humans and artificial environment to learn the ways of planing and designing original and sustainable built environment such as buildings, urban spaces and various structures by being exposed to the environmental design processes as well as the group design project

CE561 SOC (Social Overhead Capital) Policy

This course covers SOC(Social Overhead Capital) for engineering the city. Contents are divided into three parts. First part is to study various aspects for basic understandings of SOC political domains such as planning, design, construction, management, and etc. Second part is to look around SOC construction and management cases on ubiquitous and eco-friendly city. Third part is to discuss issues and prospects of SOC policies. Ultimately, the students can understand the fundamental considerations of SOC construction work.

CE562 Ubiquitous & Biomimetic Building Engineering

Biomimetics is the construction of artificial materials and systems that mimic natural forms. In this course, basic technological aspects of biomimetics will be introduced along with their applications to innovative building components and systems. Students will also have a opportunity for developing a novel ubiquitous and biomimetic building system idea through group project.

CE563 Intelligent U-Space Transportation Systems

This course provides overview on Intelligent Transportation Systems including system integration. The use of communication technologies, processing and modeling to improve the performance of transportation systems will be covered.

CE569 Human thermal environments

This course deals with the comfort conditions and equations for thermal environments of human beings, the methods of evaluating a given thermal environment, the principles for the establishment of a detailed thermal environmental analysis, and international standards.

CE571 Environmental Engineering Laboratory

This course deals with theories and experiments related to the manufacture of physical, chemical and biological reactors, operational and experimental plans, scale-up problems, and analysis / application of environmental data.

CE572 Advanced Environmental Microbiology for U-Space

The purpose of this class is to introduce the student to environmental biotechnology, in particular mediated by microbes. This course will start with basic microbiology and then cover important topics in the area of environmental biotechnology including pollutant-biodegradation and biofuel production

CE573 Advanced Wastewater Treatment

This course covers the principles and operation methods to treat wastewater using microorganisms and the purpose of discharging or to reusing the treated water without adverse impact. Also, theories on treating or recycling the sludge produced in the treatment processes are described.

CE574 Environmental Nanotechnology

Nanomaterials present new opportunities to improve our ability to detect, monitor, control, and clean up environmental contaminants and potential new risks to human health and environment. Students will learn and discuss nanotechnology application for remediation of environmental contaminants, the implication of releasing manufactured nanomaterials, and pollution control and nano-enabled sensing.

CE577 Integrate Water Resources Management

This study is designed to review fundamental principles of water and environmental management and their applications for sustainable development. Natural processes combined with human activities in watersheds determine the inherent quality of the management. That is, by responding to changing social, economic and environmental needs or impacts, one can gradually achieve better and sustainable water resources management. In this context, this course is organized to provide principles of both physical systems and human-related systems in a integrated framework.

CE579 Hazardous and Industrial Waste Treatment

This course consists of clean technologies, reduction technologies, intermediate and final waste disposal technologies in hazardous and industrial waste management. It also includes purification technologies for contaminated soil and groundwater. Term projects are required for all students.

CE580 Structural Pattern Recognition for Statistical Health Monitoring

Structural Health Monitoring(SHM) is a process chart evaluates and asses the safety and integrity of a structural system based on measured data this course deals with various structural pattern recognition tools required for SHM

CE590 Design of Unique, Complex Systems: Theory and Application

This course is intended to address the broader topics of design theory and methodology which can be applied to any project both within science and engineering and in other fields such as business and education. The principles of axiomatic design theory and complexity theory will be discussed and applied to large, unique and complex systems such as dams, bridges, transportation systems, customized manufacturing equipment, and interplanetary spacecraft where costs are high, development times are long, and only one or two final products are required. The material in the course will be suitable for advanced undergraduates and graduate students and can be offered as graduate level class and as an undergraduate elective with a shared course number. Graduate students in the course will be assigned extra readings and assignments and will be expected to develop a more sophisticated design for their final project.

CE592 Theory Methodology and Philosophy in Engineering Design

Traditional design courses in mechanical engineering and civil and environmental engineering often focus on principles of design and design methods for specific applications like machine design, product design, bridge design, building design, etc. Unlike design methodologies, design methods are rigorous, systematic, and sequential procedures for accomplishing a specific design task, instead of universal ideas which make design a systematic and conscious process with the highest possible rate of success. The author is unaware of any formal design methodologies that exist for civil or environmental engineering at this time. This course would teach students from CEE fields design methodologies from other fields (especially mechanical, industrial and architecture) and enable them to create a design methodology that is equally applicable for CEE.

CE596 Special Topics in Structural Engineering Design for U-Space

Learn basic design principles, theories and methodologies related to U-space structures through discussions with invited speakers

CE597 Special Topics in Geotechnical Engineering Design for U-Space

This course deals with methods to solve geotechnical engineering problems related with U-Eco city construction. Especially, the students learn U-Geotechnical design concepts to prevent any natural or manmade disasters caused by failures of geotechnical structures. This course is possible to give a subtitle to deal with methods to mingle geotechnical problems with U-concepts.

CE598 Special Topics in Environmental Engineering Design for U-Space

In this lecture, students can analyze the cause of local and global environmental problems of 21 century and learn how to develop and design environmental technologies which can provide basic understanding on the solutions to

protect and overcome natural and environmental disasters due to the local and global environmental problems.

CE599 Special Topics in U-Space Construction IT Design

This course is targeted to familiarize CEE graduate students with applied robotics other than EECS and ME. This course helps students understand general civil robotics issues and apply robot techniques to civil engineering application area. Specifically the students can understand fundamental principles of robotics, HRI (Human-Robot Interaction), and problem solving techniques using them.

CE611 Inelastic Analysis of Reinforced Concrete Structures

This course covers creep and shrinkage in RC structures, thermal effects and analysis of RC structures, limit design and yield line theory, application of fracture mechanics to concrete structures, and nonlinear analysis by Finite Element Method.

CE614 Stability of Structures for U-Space

To reserve the stability of structural members subject to axial load together with lateral loads, the structural behavior of each member is analyzed and, in advance, the corresponding critical load to be resisted is calculated. Various structural members such as beam-column, rigid frame, ring and arched members are considered, and the exact understanding for the background of design codes is achieved on the basis of structural stability.

CE617 Earthquake Engineering

This course covers the mechanism of earthquake occurrence, tectonic plate theory, engineering characteristics of earthquake, seismic hazard analysis, earthquake ground motion, response spectra, dynamic responses of structures subjected to earthquake, nonlinear structural responses, frequency domain analysis, preventive design of structures (buildings, bridges, and underground structures), soil-structure interaction, probabilistic earthquake risk analysis, and earthquake mitigation and management.

CE619 Vibration Control of Structures

This course introduces the theory of structural passive and active control, applications to vibration isolation, damping treatment, and dynamic absorbers, application to tall buildings, cable-stayed bridges, and tension structures, design of classical feedback control systems for civil structures, and simulation studies using customized computer software.

CE631 Advanced Numerical Soil Mechanics

This course discusses the applicable numerical methods to geotechnical problems. The geotechnical problems that are dealt with in this course are seepage, consolidation, displacements of retaining and underground structures, excavations, embankment, etc. The numerical analysis methods such as the finite difference method (FDM), the finite element method (FEM), the boundary element method (BEM), and the discrete element method (DEM) are used to solve the geotechnical problems.

CE633 Advanced Soil Dynamics

This course deals with elastic wave propagation (bar, infinite media, half space), site investigation using elastic waves, dynamic soil properties, nondestructive test and evaluation, vibration criteria, monitoring and control, and machine foundations.

CE634 Signal Processing for civil Engineering

This course covers signal processing and system identification for civil engineering problems focused on signals and systems, time and frequency domain analysis, nonlinear system, discrete inversion analysis, system identification analysis, and tomography imaging.

CE636 Geotechnical Earthquake Engineering

This course deals with performance based seismic design code, earthquake ground motion, soil liquefaction, evaluation of dynamic soil properties, seismic design of various geotechnical structures.

CE637 Theory of Geophysics

This course covers the principles of elastic and electromagnetic waves, applied to geophysical characterization, to understand the interaction of soil and water, conduction and diffusion, elastic wave in soil, electromagnetic wave in soil, wave velocity and attenuation, elastic and electromagnetic wave measurements in laboratory, and their

applications.

CE672 Advanced Environmental Unit Processes

This course is to discuss about physico-chemical principles of environmental engineering processes including process principles, theories, equations and applications. This course will give emphasis on process principles rather than unit operations. This is because an understanding of process mechanisms and control variables is fundamental for the effective application of unit operations to accomplish specific treatment objectives.

CE673 Advanced Environmental Remediation Engineering

The goal of this course is to identify the fate and transport of toxic contaminants in soil and groundwater environments, to understand physicochemical and biological phenomena, and to develop an ability to apply basic and advanced theories of remediation processes to the in-situ and ex-situ treatments.

CE960 M.S. Thesis

CE966 M.S. Seminar

CE980 Ph.D. Thesis

CE986 Ph.D. Seminar
